

United International University (UIU)

Dept. of Computer Science & Engineering (CSE)

Final Exam Total Marks: **50** Summer 2024
 Course Code: CSE 2217 Course Title: Data Structure and Algorithms II
 Time: **2 hours**

Any examinee found adopting unfair means will be expelled from the trimester / program as per UIU disciplinary rules.

There are **five** questions. **Answer all of them.** Show full simulation/tabulations wherever necessary. Figures in the right-hand margin indicate full marks.

1.	<p>(a) Suppose a Mayor wants to connect 6 cities (A, B, C, D, E, F) by constructing roads among them. Constructing a road between two particular cities requires a certain cost. One can travel in both directions using a road. The cost to construct a road between two particular cities is given in the following table. Find the minimum cost required to connect all cities by constructing roads. Use an efficient algorithm and clearly mention the name of the algorithm you are using.</p> <table><tr><td>Roads between cities</td><td>A and B</td><td>B and D</td><td>C and D</td><td>C and E</td><td>A and C</td><td>E and F</td><td>A and F</td><td>A and D</td></tr><tr><td>cost</td><td>7</td><td>12</td><td>10</td><td>8</td><td>10</td><td>12</td><td>15</td><td>10</td></tr></table> <p style="text-align: center;">Table 1 : Road construction Costs between cities</p> <p>(b) If all the edge weights are positive in a Graph, then how can you find Maximum Spanning Tree using Kruskal or Prim’s algorithm? Provide your idea by giving an example. You do not need to write any pseudocode [<i>A maximum spanning tree is a spanning tree of a graph with the highest possible sum of edge weights.</i>]</p> <p>(c) Which Minimum Spanning Tree (MST) algorithm will you use between Prim and Kruskal for the following types of graphs? Justify mentioning the time complexity of the algorithms.</p> <p style="text-align: center;">i) Dense Graph ii) Sparse Graph</p>	Roads between cities	A and B	B and D	C and D	C and E	A and C	E and F	A and F	A and D	cost	7	12	10	8	10	12	15	10	[5]

2.	<p>(a) Table 2 shows the parent array of a Disjoint set (Rooted tree implementation). Perform the following operations sequentially using path compression and union-by-rank heuristic..</p> <p>i. Draw the disjoint set forest</p> <p>ii. What will be returned by Find-Set(13), and Find-Set(3)? (Redraw the forest)</p> <p>iii. Redraw the forest after Union(6, 10). Show necessary steps</p> <table><tr><td>Index</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td></tr><tr><td>Parent</td><td>1</td><td>1</td><td>1</td><td>3</td><td>4</td><td>5</td><td>7</td><td>7</td><td>7</td><td>9</td><td>2</td><td>7</td><td>12</td><td>13</td></tr></table> <p style="text-align: center;">Table 2 : Parent array of a Disjoint set</p> <p>(b) Why do we use the heuristics: union-by-rank and path-compression in Disjoint-Set data structure? Explain your answer through appropriate example(s).</p>	Index	1	2	3	4	5	6	7	8	9	10	11	12	13	14	Parent	1	1	1	3	4	5	7	7	7	9	2	7	12	13	[2] [1] [3]
Index	1	2	3	4	5	6	7	8	9	10	11	12	13	14																		
Parent	1	1	1	3	4	5	7	7	7	9	2	7	12	13																		
3	<p>(a) Dijkstra's algorithm does not work correctly on graphs with negative edges, even if there are no negative cycles. Use a graph with negative edges (but no negative cycles) to show why</p>	[3]																														

Dijkstra's algorithm can fail. Draw a **diagram to explain** your answer.

(b) Determine the **shortest paths** from **vertex 1** to all other vertices in the graph given in Figure 1. Show all the necessary calculations step-by-step. Additionally, **print** both the **shortest distances** and the **corresponding paths** for each vertex.

[5]

Figure 1 : A weighted directed graph

(c) **Justify** the following statement with **an appropriate example**: “The single source shortest path problem satisfies the optimal substructure property”.

[2]

(d) “If all the edges of a graph have equal weights, then **Breadth First Search (BFS)** gives the Minimum Spanning Tree and Single Source Shortest Path more efficiently than any other algorithms you have studied in this course” - do you agree or not? Show logical reasoning. **You don't have to show any simulation using BFS.**

[2]

(e) Consider the following graph in Figure 2. Use **topological sort** starting from **node 2** to find a linear ordering of the nodes. Show details.

[3]

Figure 2 : Graph for topological sort

4 (a) **Explain** a scenario in which the Rabin-Karp algorithm **performs no better than** the naive string matching algorithm.

[2]

	<p>(b) You are tasked with finding all occurrences of a specific pattern within a text using a hash-based pattern-matching approach. The characters in the text and pattern are represented as follows:</p> <table><tr><td>char</td><td>a</td><td>b</td><td>c</td><td>d</td><td>f</td></tr><tr><td>code</td><td>2</td><td>3</td><td>5</td><td>7</td><td>11</td></tr></table> <p>The hash function is defined as follows:</p> $hash(s) = \left(\sum_{i=0}^{m-1} (s[i] * d^i) \bmod q \right) \bmod q$ <p>where, m = size of the string you want to hash d = m + p, where p = 3 q = 131 For string s = "bfd" , s[0] = 'b', s[1] = 'f', s[2] = 'd'. Given this information, find all occurrences of the pattern "abd" in the text "abfabd". Show the indices of both valid hits and spurious hits (if any) using the aforementioned hash function.</p>	char	a	b	c	d	f	code	2	3	5	7	11	[5]																
char	a	b	c	d	f																									
code	2	3	5	7	11																									
5	<p>(a) Define three types of probing in open addressing with proper examples. State pros and cons of each probing mechanism.</p> <p>(b) Consider an open-addressing hash table as shown below (Table 3). The table already contains four data items. Assume that collisions are handled by the following hash function.</p> $h(k,i) = (h' (k) + i h''(k)) \bmod m,$ <p>where $h'(k) = (2k+7) \bmod m$ and $h''(k) = 1 + (3k \bmod m)$; $m = 13$</p> <p>By showing calculations, redraw the table and show following operations</p> <div><div>i. Insert 52</div><div>ii. Insert 70</div><div>iii. Delete 98, Replace with NIL</div><div>iv. Search 40</div></div> <table><tr><td>Index</td><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td></tr><tr><td>Value</td><td></td><td></td><td></td><td></td><td>83</td><td>12</td><td></td><td></td><td>98</td><td>27</td><td></td><td></td><td></td></tr></table> <p>Table 3: Open Addressing Table</p> <p>(c) What is primary clustering? Do you think there is any 'primary clustering' in Table 3? Justify your answer.</p>	Index	0	1	2	3	4	5	6	7	8	9	10	11	12	Value					83	12			98	27				<div>[1]</div> <div>[2]</div> <div>[1]</div> <div>[1]</div> <div>[2]</div>
